# Managing Queue Job with Yii2

YIICONF INDONESIA 2017 - DAY 1

## Apa itu...?

"Message Queues and mailboxes are software-engineering components used for inter-process communication (IPC), or for inter-thread communication within the same process. They use a queue for messaging – the passing of control or of content. Group communication systems provide similar kinds of functionality."

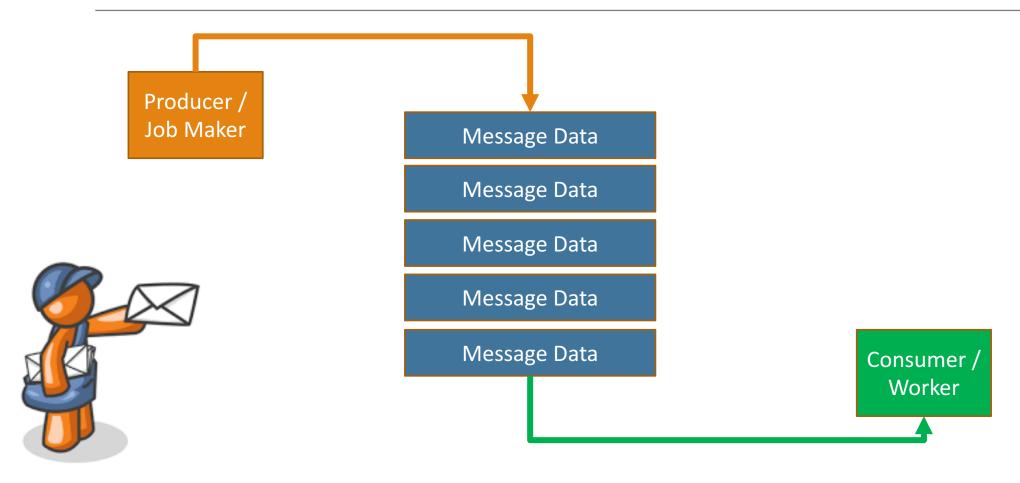

https://en.wikipedia.org/wiki/Message\_queue

# Apa itu....?

Messaging describes the sending & receiving of data (in the form of messages) between systems.

Messages are exchanged between programs or applications, similar to the way people communicate by email but with guarantees on delivery, speed, security and the absence of spam - FAQ RabbitMQ

### Gambaran Umum

# Jadi... Apa itu Message Queue itu?

- Sebagai framework untuk bertukar pesan
- Sebuah cara komunikasi antar aplikasi / sistem
- Sebuah cara untuk decouple-components
- Sebuah cara mengurangi beban kerja sistem

# Manfaatnya apa saja?

- Proses function php cita-rasa asyncronous
- Komunikasi antar aplikasi / sistem
- Chat
- Pengiriman mail
- Proses gambar / video / compressed package
- • • • •

# Kapan harus pakai Message Queue?

- Jika suatu proses sejatinya bisa berjalan di-background
- Jika suatu proses dalam area terisolasi harus saling berkomunikasi
- Jika suatu aplikasi / sistem butuh saling "berkomunikasi"
  - Umum terjadi karena satu aplikasi dgn aplikasi lain beda bahasa pemrograman

### Macam-macam Message Queue

- Amazon Simple Queue Service
- Beanstalkd
- Gearman
- RabbitMQ
- OpenAMQ

#### Memilih Server Queue

Based On AMQ (Advanced Message Queue) Protocols

- RabbitMQ
- 2. Apache QPID/Red Hat MRG
- 3. OpenAMQ

Use XMPP (Exntensible Messaging and Presence Protocol): Ejabberd

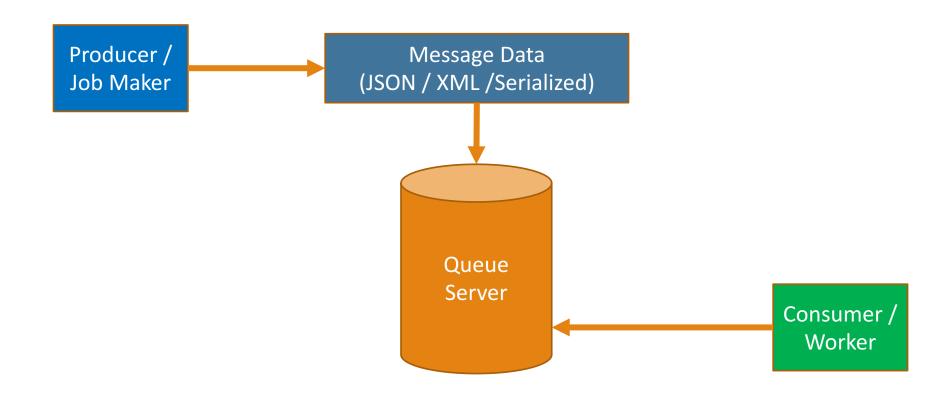

Use Stomp (Streaming Text Oriented Queue Protocol): ActiveMQ, Sprinkle

#### Lainnya:

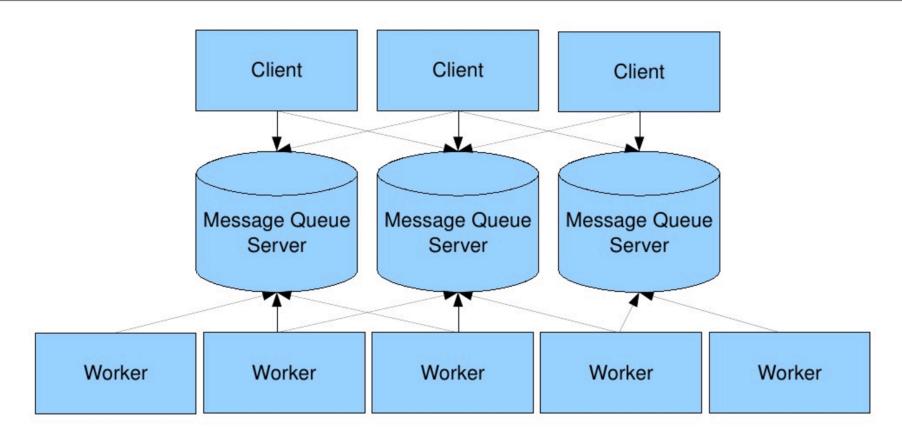

- 1. Beanstalkd
- 2. PSYC
- 3. Gearman
- 4. Amazon SQS
- IRC
- 6. Starling
- 7. SMTP
- 8. ZeroMQ

http://wiki.secondlife.com/wiki/Message\_Queue\_Evaluation\_Notes

### Arsitektur Sederhana

# A bit complex

# Penting untuk diperhatikan!

Consumers / Worker harus selalu dipantau!

Gunakan supervisord! -> <a href="http://supervisord.org/">http://supervisord.org/</a>

#### High Availability

- Untuk skalabilitas, pertimbangkan untuk pakai load-balancer.
- Tidak semua client memiliki dukungan untuk multiple-servers. Anda perlu melakukan abstraksi sendiri.

## Demo Queue dengan Beanstalkd

Server: beanstalkd > <a href="http://kr.github.io/beanstalkd/">http://kr.github.io/beanstalkd/</a>

Rekomendasi OS: Linux
